

In-cosmetics Europe (in Barcelona, Spain)

14-16 April, 2015

We, Daiichi Fine Chemical Co. Ltd. and our group company, Kyowa Hakko Europe GmbH, DFC division are attending the In-Cosmetics in Barcelona and excited to introduce our product PANADOXINE™ P which is a stable vitamin B₆ derivative and clinically shown the effect to reduce the appearance of pore and facial shine. Furthermore, in our latest study, the application of this Panadoxine™P on legs over the course of 10 days, it gave a significant improvement in hydration and helped prevent razor burn.

Also, we have unique liposomal products comprised of multi-lamellar liposomes which provide high skin permeability and stability of encapsulated ingredients. One of our liposomal products is "Panosome™ CoQ10" which provides high skin permeability of liposome and CoQ10. Another one is "Panosome™ Lutein". Lutein has effects to protect skin from active oxygen caused by UV damage and photooxidative stress by absorption blue light, so it may give our skin beneficial effects such as improving elasticity and hydration. However, Lutein itself is unstable against light and high temperature, therefore we have developed Panosome Lutein which improves its stability against those factors so Lutein's original good effects can be performed.

We will be pleased to welcome you at booth no. 7E51 / Hall 7
